

BUSINESS PROPOSAL

Modular "Plug-and-Play" AI-Agent Platform for Enterprise Onboarding

Activate a fully working AI customer-support and CRM agent for any Egyptian business in hours, not weeks, simply by uploading its policies, knowledge documents and customer data structures.

Hours	Arabic-first	-60%+	PDPL-ready
to first working agent, not weeks	Egyptian dialect + English	service cost vs. a manual team	Egypt-hosted data option

Prepared for: prospective pilot customers and enterprise partners in Egypt
Market focus: Egypt (telecom & subscription services, e-commerce, fintech, hospitality & travel, airlines)
Version 1.0 | September 2026 | All figures in EGP with USD equivalents at 51.5 EGP/USD
Confidential. Market figures are drawn from public sources listed in the Appendix; forecasts are management estimates and design targets, not guarantees.

1. Title and One-line Value Proposition

Modular "Plug-and-Play" AI-Agent Platform for Enterprise Onboarding

In short: One sentence: a new business uploads its policies, documents and customer-data structure, and within hours it has a working AI agent that answers customers in Arabic and English, takes real actions on its data (orders, tickets, bookings, accounts), and hands anything risky to a human.

The value proposition in one line

"Plug in your business, and a safe, action-taking AI support agent is live within hours, with only light adjustments and no development project."

Why this matters now in Egypt

- **Customers already live on chat.** Egypt has 98.2 million internet users (82.7% penetration) and roughly 57 million WhatsApp users; over 90% of Egyptian businesses use WhatsApp to talk to customers.
- **Human support is the bottleneck.** An Arabic-speaking agent costs EGP 7,000-14,000 per month before employer costs, cannot cover 24/7 alone, and takes weeks to train on a company's policies.
- **AI is ready, but deployment is not.** Existing tools either give fast FAQ bots that cannot act on business data, or powerful platforms that need developers and weeks of integration.
- **The market is growing fast.** Egypt's conversational-AI market is estimated at USD 200 million in 2025, growing 23.1% a year to USD 696 million by 2030.

Sources: DataReportal Digital 2026: Egypt; ChatDaddy WhatsApp in Egypt 2026; WUZZUF call-center salary guide 2026; MarketsandMarkets Egypt Conversational AI Market.

2. Executive Summary / The Big Idea

In short: We are building the fastest way for an Egyptian business to get a trustworthy AI support and CRM agent. Instead of a months-long chatbot project, the business drops in its documents and data structure, the platform builds the knowledge base and the action tools automatically, and a business owner adjusts the agent in plain language from a Control Center. We will prove this with paid pilots in five verticals in 2027.

USD 200M	EGP 22.8M	~88	9:1
Egypt conversational-AI market 2025, 23.1% CAGR	Revenue target 2029 (~300 SMB + 4 enterprise)	paying customers to break even (2028 cost base)	LTV to CAC ratio (base case)

What we are proposing

- **The product:** a multi-tenant platform with two faces. A customer-facing agent (WhatsApp, website, Messenger, Instagram; voice later) that answers from the business's own policies and executes approved actions on its data. And a Business Owner Control Center where a non-technical owner uploads documents, reviews what the agent can do, adjusts rules in plain language and audits every action.
- **The onboarding promise:** low developer involvement. Knowledge ingestion and tool creation are automated from uploaded documents, spreadsheets, database schemas or API specifications. Light adjustments replace heavy integration work.
- **The safety promise:** every action is bounded by the business's own policies and confidence thresholds; anything ambiguous, sensitive or out of scope is escalated to a human with full context.
- **The business model:** flat monthly subscription tiers in EGP (Starter EGP 2,500, Growth EGP 7,500, Business EGP 20,000, Enterprise from EGP 60,000) with conversation allowances, plus paid 60-day pilots at EGP 5,000.
- **The ask:** 5-8 founding pilot customers across telecom/ISP, e-commerce, fintech, hospitality/travel and airlines, starting Q1 2027.

Why we will win

Local bot builders (Hulul/WideBot) are fast but stop at scripted FAQs; global platforms (Intercom, Zendesk) act on data but are priced in dollars, need integration work and are not built for Egyptian Arabic or Egypt's data-protection regime. We sit in the empty quadrant: fast to onboard and able to act on business data, priced in EGP, Arabic-first and PDPL-aware.

3. Problem Statement

In short: Egyptian businesses are drowning in repetitive customer conversations on WhatsApp and social media, but the two ways to fix it, hiring more agents or building a chatbot, are both slow, expensive and unreliable for a small or mid-sized company.

Who suffers, how often, and what it costs

Stakeholder	What happens today	Evidence / scale
Business owner / operations manager	Pays a growing team to answer the same 30-50 questions; still misses messages at night and on weekends; cannot see what was promised to customers.	Arabic agent EGP 7,000-14,000/month; English EGP 12,000-21,000/month; fully loaded ~x1.3.
Customer	Waits hours for an answer, repeats information across channels, escalates to a hotline or a regulator.	NTRA received 141,224 telecom complaints in H1 2026; fixed-broadband complaint rate 336 per 100,000 subscribers.
Support agent	Copy-pastes policy text, switches between CRM, order system and WhatsApp; burns out; leaves within months.	High churn is structural in Egyptian BPO; entry pay near the EGP 7,000 minimum wage.
IT / developers	Asked to 'build a bot' on top of daily work; each new policy or product change requires code changes.	Mid-level backend developer EGP 21,000-44,000/month; projects take weeks to months.
Travellers & subscribers (airlines, telecom)	Baggage, refund, delay and billing enquiries go unanswered; brand damage is public.	EgyptAir averaged ~20 complaints per 100 flights (Canadian Transportation Agency, 2023-24).

The core problem, stated plainly

A business cannot get an AI agent that (a) knows its own policies, (b) can actually do things on its systems, (c) is safe enough to trust with customers, and (d) can be set up and changed by non-technical staff. Today you can have two or three of these four, never all four, and never quickly.

Sources: WUZZUF and Ta3Heed 2026 salary data; NTRA H1 2026 complaint statistics via Business Tech News; CV Pro Maker Egypt tech salaries 2026; AirAdvisor citing the Canadian Transportation Agency.

4. Current Situation / Root Causes

In short: The problem persists because every current option pushes the hard work onto people: agents memorise policies, developers hand-code integrations, and bot builders make owners draw flowcharts. Nothing turns a company's existing documents and data into a working agent automatically.

Five whys

1. Why do businesses still answer most messages manually? Because their chatbots cannot answer policy questions accurately or take actions.
2. Why can't the chatbots do that? Because they are built from scripted flows and FAQs, not from the company's real documents and systems.
3. Why aren't they connected to real documents and systems? Because connecting them requires developers to write and maintain integrations.
4. Why is developer work the blocker? Because in Egypt mid-level developers cost EGP 21,000-44,000/month and are scarce; SMEs cannot dedicate one to support tooling.
5. Why has nobody automated the integration step? Because until recently, models could not reliably read a schema or API spec and generate safe, bounded tools; that is now possible, and it is the core of this platform.

Why current methods fall short

Current approach	Strength	Why it is insufficient
Hire more agents	Flexible, human judgement	Linear cost growth, 8-hour coverage, inconsistent answers, weeks of training per hire.
Flow-builder chatbots (drag-and-drop)	Fast, cheap, Arabic support	Break on any question outside the script; cannot look up an order or change a booking; owner must maintain flows.
Global AI helpdesks (Intercom, Zendesk, Freshdesk)	Strong AI, integrations	Priced in USD per seat and per resolution; integrations still need developer work; weak on Egyptian dialect; data hosted abroad.
Custom in-house build	Fully tailored	3-6 months, EGP 300,000+ in developer time, then permanent maintenance; every policy change is a code change.
Outsourced call centre (BPO)	Scales quickly	Same per-agent economics, less knowledge of the business, quality risk.

What changed

Three shifts make the automated approach viable now: (1) budget-tier language models cost about USD 0.20-0.25 per million input tokens, so a full conversation costs a fraction of an Egyptian pound; (2) models can reliably generate structured tool definitions from schemas and API documents; (3) Meta's WhatsApp Business Platform and Egypt's fibre and 4G/5G roll-out have made chat the default channel for both consumers and businesses.

Sources: CV Pro Maker Egypt tech salaries 2026; OpenAI, Google and Anthropic public API price lists (Sept 2026); Meta WhatsApp Business Platform pricing.

5. Target Customer Segments

In short: We target Egyptian businesses that already handle high volumes of customer conversations and have written policies and structured customer data: telecom and subscription services, e-commerce, fintech, hospitality and travel, and airlines. The platform is horizontal by design; these five are where the pain and the willingness to pay are highest today.

Segmentation matrix

Segment	Typical customer profile	Conversation drivers	Buyer / decision maker	Egypt scale
Telecom, ISPs and subscription services	Mobile operators, ISPs and resellers, streaming, SaaS and membership businesses	Billing questions, outages, plan changes, cancellations	Head of customer care / COO	4 mobile operators, 12.7M fixed-broadband lines; WE alone 15.3M mobile + 11.2M data subscribers
E-commerce and online retail	Brands and stores selling via web, Instagram and WhatsApp	Order status, returns, delivery, payment	Founder / e-commerce manager	Market USD 11.5B in 2026; 35M+ online shoppers; 72% of value on smartphones
Fintech and lending	Wallets, BNPL, microfinance, payment providers	KYC status, transaction disputes, limits, fees	Head of operations / compliance	227 active fintech companies; sector USD 765M (2024) growing ~15.8%/yr
Hospitality and travel	Hotels, tour operators, restaurants, travel agencies	Bookings, changes, multilingual enquiries, complaints	GM / revenue manager	19M tourists in 2025 (+21%); ~1,300 hotels; 2,240 tourism companies; 1,620 tourist restaurants
Airlines and air-travel services	National, low-cost and charter carriers; GSAs; ground handlers	Flight status, baggage, refunds, rebooking	VP customer experience / CIO	Enterprise-tier accounts; charter traffic +32% in 2025; arrivals from 193 cities

Primary vs secondary focus

- **Primary (self-serve tiers, 2027):** e-commerce brands and hospitality/travel SMEs with 500-20,000 conversations a month. Fast decisions, clear ROI, WhatsApp-native.
- **Primary (enterprise tier, from 2028):** telecom/ISP resellers, subscription services, fintechs and airlines with complex policies and strict escalation needs.
- **Secondary (any domain):** clinics, education, real estate, logistics. The same ingestion and tool-generation engine applies with light adjustments; we will serve inbound demand but not market to these verticals until 2028.

Persona: the business owner we serve first

Mariam runs an online fashion brand in Cairo with 4 support staff answering 6,000 WhatsApp and Instagram messages a month. She has a return policy PDF, a Shopify export of orders and a Google Sheet of customers. She is not technical, has no developer, and loses sales every evening after her team logs off. She will pay for something that works in Arabic, respects her policies, and that she can change herself.

Sources: TelecomLead Best ISPs in Egypt 2026; Telecom Egypt Q1 2026 results; Mordor Intelligence Egypt E-commerce 2026; Tracxn Egypt FinTech (May 2026); ICLG Fintech Egypt 2026; Xinhua and Zawya/IDSC tourism 2025; Ministry of Tourism statements.

6. Customer Journey and Pain Points

In short: Today the journey from 'we need better support' to 'it works' is long and frustrating for the business owner, and the end customer's journey is full of waiting and repetition. The platform collapses the owner's journey to hours and gives the end customer an instant, consistent answer.

The business owner's journey today (before)

Stage	What the owner does	Pain	Typical time / cost
1. Realise	Notices missed messages, lost sales, complaints	No data on what customers ask	Months of leakage
2. Search	Compares bot builders, agencies, freelancers	Confusing, mostly USD pricing, unclear Arabic quality	2-4 weeks
3. Decide	Picks a flow-builder bot or an agency	Has to write scripts or a requirements document	1-2 weeks
4. Build	Draws flows or waits for developers to integrate	Every policy change is rework; integrations slip	4-12 weeks; EGP 50,000-300,000+
5. Launch	Bot goes live, breaks on real questions	Customers say 'I want a human'; staff switch it off	Days to abandonment
6. Maintain	Nobody owns updates	Bot drifts out of date; ROI never measured	Ongoing

The business owner's journey with the platform (after)

1. Sign up and pick a plan in EGP (minutes).
2. Upload policies, FAQs, product documents and a data source (spreadsheet, CRM export, database schema or API spec).
3. Review the auto-generated knowledge base and the proposed action tools ('look up order', 'open ticket', 'change booking date') and switch on the ones you want.
4. Test-chat with the agent in Arabic and English; adjust tone and rules in plain language in the Control Center.
5. Connect WhatsApp, website widget or Instagram and go live; a human inbox receives escalations.
6. Watch the dashboard: resolution rate, escalations, top unanswered questions; update a policy by uploading the new document.

Design target: first working agent within one hour for a business with documents and a standard data source; complex or custom integrations typically 1-3 days with light developer adjustment. These are targets to be validated in the pilots, not guarantees.

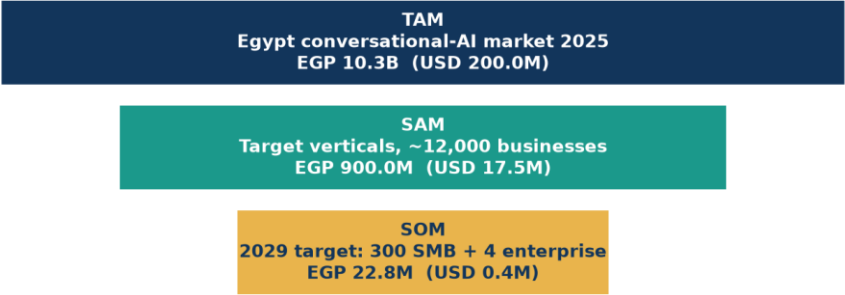

The end customer's journey

Moment	Before	After
Asks 'where is my order?' at 10 pm on WhatsApp	Auto-reply 'we will get back to you'; answer next morning	Instant answer with tracking status pulled from the order system
Wants to change a booking date	Back-and-forth over 5 messages; agent checks a system manually	Agent checks availability, applies the change policy, confirms in one exchange
Disputes a charge	Repeats details on hotline, then email	Agent verifies identity per policy, records the dispute, escalates to a human with full context
Asks something unusual or sensitive	Bot loops or gives a wrong answer	Agent says it will bring in a colleague and hands over immediately

7. Market Opportunity

In short: The problem is commercially worth solving. Egypt's conversational-AI market is USD 200 million today and heading to nearly USD 700 million by 2030, on top of a digital base of 98 million internet users and the largest WhatsApp audience in the Arab world.

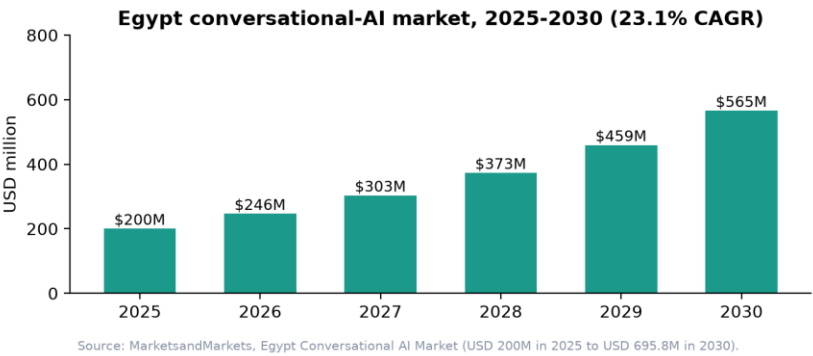

Market sizing: TAM / SAM / SOM (annual revenue, EGP)

How we size the market

Layer	Definition	Size (annual)	Basis
TAM	Spending on conversational AI (chatbots, virtual assistants, platforms, services) in Egypt	USD 200M (2025) = EGP 10300.0M; USD 696M by 2030	MarketsandMarkets, Egypt Conversational AI Market, 23.1% CAGR
SAM	Egyptian businesses in our five verticals (plus medium enterprises) with high conversation volumes and written policies: ~12,000 organisations	~EGP 900M (USD 17M)	Bottom-up: ~12,000 businesses x blended ~EGP 75,000/year
SOM	Planned by end-2029: ~300 SMB subscriptions and 4 enterprise contracts	EGP 22.8M (USD 443K)	~2.5% of SAM; forecast in Section 22

Growth and trends

- **Digital demand:** 98.2M internet users (82.7%), ~57M WhatsApp users, 35M+ online shoppers.
- **Verticals growing faster than GDP:** e-commerce USD 11.5B in 2026 (11.9% CAGR); fintech ~15.8% CAGR; tourism arrivals +21% in 2025, 30M target.
- **Regional path:** MEA conversational-AI market USD 1.2B (2024) to USD 3.5B (2030), 19.7% CAGR; Arabic-first capability travels to the GCC.
- **Policy tailwind:** Digital Egypt, the national AI strategy and Cashless Egypt push businesses toward digital service channels.

Sources: MarketsandMarkets; Grand View Research; DataReportal Digital 2026: Egypt; Mordor Intelligence; AmCham Egypt / IMARC; Xinhua (Jan 2026). SAM organisation count is a management estimate built from CAPMAS, CBE FinTech Egypt, Ministry of Tourism and NTRA figures.

8. Solution Overview

In short: A single platform with two interfaces: a customer-facing AI agent that answers and acts, and a Business Owner Control Center that lets a non-technical owner set it up, adjust it and audit it. The platform does the heavy lifting of turning documents and data structures into knowledge and tools automatically.

What the business gets

Component	What it does for the business
Customer-facing agent	Answers questions grounded in the business's own policies, in Egyptian Arabic and English; executes approved actions (look up, create, update) on the business's data; works on WhatsApp, website chat, Messenger and Instagram; voice in a later phase.
Business Owner Control Center	Upload and version documents; see and switch on/off the auto-generated action tools; set rules and tone in plain language; review every action the agent took; manage the human escalation inbox; see KPIs.
Automated knowledge ingestion	PDF, Word, spreadsheets, web pages and FAQs are parsed, chunked and indexed into a tenant-isolated knowledge base within minutes of upload.
Automated tool generation	From a customer-data schema, spreadsheet, CRM export or API specification, the platform proposes bounded action tools (e.g., <code>get_order_status</code> , <code>update_delivery_address</code> , <code>create_ticket</code>) with validation and permissions; the owner approves them.
Safety and escalation	Policy-derived guardrails, confidence thresholds, identity verification steps and automatic hand-over to a human with the full transcript and context.
Compliance layer	Tenant isolation, audit log of every answer and action, data-retention controls and an Egypt-hosted data option aligned with the PDPL.

Before and after, at a glance

	Before (typical Egyptian SME)	After (with the platform)
Time to a working agent	4-12 weeks project	Hours to a few days (design target)
Who sets it up	Developers or an agency	The business owner, with light adjustments
What the agent can do	Answer scripted FAQs	Answer from real policies and act on real data
Coverage	Business hours	24/7 with human escalation
Language	Formal Arabic or English	Egyptian dialect, Arabic and English, auto-detected
Changing a policy	Ticket to IT	Upload the new document
Cost basis	Per agent salary	Flat EGP subscription

9. How the Solution Works (business-friendly)

In short: Three steps for the business: upload, review, go live. Behind the scenes, the platform reads what you uploaded, builds a private knowledge base, drafts the tools the agent may use on your data, and wraps everything in your policies and an escalation path.

Step-by-step

Step	The business does	The platform does	Typical time
1. Drop and load	Uploads policies, FAQs, product documents; connects a data source (spreadsheet, CRM export, database schema or API spec).	Parses documents; detects languages; indexes knowledge into an isolated tenant workspace; reads the data structure.	10-30 minutes
2. Auto-generate	Nothing yet.	Proposes action tools (read/create/update) with field validation and permission levels; derives guardrails from the policy text (e.g., 'refunds only within 14 days').	Minutes
3. Review and adjust	Approves or disables tools; sets tone; adds rules in plain language ('never promise delivery dates'); test-chats.	Applies changes instantly; shows sample answers with the source passage highlighted.	30-60 minutes
4. Go live	Connects WhatsApp, web widget, Messenger/Instagram; names the humans who receive escalations.	Routes conversations; executes approved actions; escalates out-of-scope or low-confidence cases with context.	Same day
5. Operate and improve	Reviews the dashboard and unanswered questions weekly; uploads updated documents.	Re-indexes; suggests new tools when new data fields appear; reports resolution, escalation and satisfaction.	Ongoing, minutes/week

Runtime: what happens in a conversation

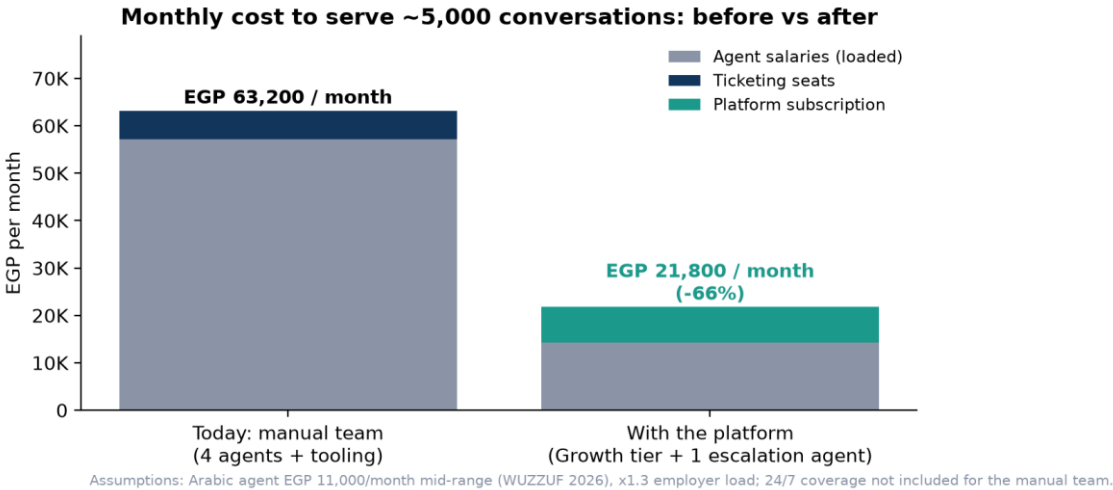

1. A customer writes on WhatsApp in Egyptian Arabic: 'the internet has been down since morning, and my bill went up'.
2. The agent verifies the customer per the business's rule (e.g., registered number plus account ID) and retrieves the relevant policy passages (outage compensation, billing cycle).
3. It calls approved tools (get_account_status, get_last_invoice), explains the bill change with the actual line items, and opens a technical ticket via create_ticket with a reference number.
4. If the customer asks for a refund beyond policy, or frustration rises above a threshold, it hands over to a human with the full transcript and the data already gathered.
5. Everything is logged; the owner sees it in the Control Center audit trail.

Worked examples across five industries

Industry	Uploaded by the business	Auto-generated tools (examples)	Always escalated to a human
Telecom / ISP / subscriptions	Tariff sheet, outage policy, subscriber export or billing API	get_account_status, get_invoice, change_plan, create_ticket	Contract termination, disputed charges above a set amount
E-commerce	Return and shipping policy, product catalogue, order export or store API	get_order_status, update_address, create_return, apply_voucher	Fraud signals, refunds outside policy
Fintech / lending	Fees schedule, KYC FAQ, transaction API (read-only by default)	get_kyc_status, get_transaction, create_dispute	Any account change, suspected fraud, complaints to the regulator
Hospitality / travel	Booking terms, hotel/tour information, reservation system export	get_booking, change_dates (within policy), request_service	Overbooking, refunds, medical or safety issues
Airlines	Fare rules, baggage policy, PNR/booking API, flight status feed	get_flight_status, get_booking, open_baggage_claim (PIR), rebook_within_rules	Compensation claims, irregular operations, special-assistance needs

10. Value Proposition

In short: Businesses pay because the platform cuts the monthly cost of service by more than half, answers customers around the clock, protects the business with policy-bound actions, and removes the developer dependency that has killed previous chatbot projects.

Measurable benefits

Benefit	What it means	Indicative measure
Lower cost to serve	Replace 3-4 shifts of repetitive answering with a flat subscription plus one escalation agent	-60% or more on monthly support cost for ~5,000 conversations (chart above)
Faster answers, 24/7	Median first response in seconds instead of hours; night and weekend coverage without overtime	First-response time from hours to under 1 minute
More revenue captured	Answers pre-purchase questions and completes order or booking changes at any hour	Pilot KPI: conversion of pre-sale chats, recovered after-hours enquiries
Fewer errors and disputes	Answers come from the policy text, actions are validated and logged	Reduction in complaint volume and NTRA/regulator escalations
Speed to value	Hours to a working agent instead of a 4-12 week project	Time-to-first-resolution measured in every pilot
Control without code	Owner changes tone, rules and documents in plain language	Zero developer tickets for policy changes
Compliance comfort	Tenant isolation, audit trail, Egypt-hosted option, retention controls	Supports PDPL obligations; breach-notification readiness

Value proposition canvas (summary)

Customer jobs	Pains we relieve	Gains we create
Answer customers fast and correctly; keep policies consistent; keep costs predictable; stay compliant	Missed messages, agent churn, developer dependency, bots that break, USD pricing, data abroad	24/7 coverage, EGP flat pricing, owner-controlled agent, real actions on data, audit trail, Arabic that sounds Egyptian

Sources: Cost comparison assumptions: Arabic agent EGP 11,000/month (mid-range of WUZZUF 2026 EGP 7,000-14,000), employer load x1.3, EGP 1,500/seat ticketing tool, Growth tier EGP 7,500/month.

11. Unique Selling Points / Competitive Advantages

In short: Five pillars make the offer hard to copy quickly: automated tool generation, plug-and-play onboarding, Egyptian Arabic, built-in safety with escalation, and EGP pricing with Egypt-hosted data.

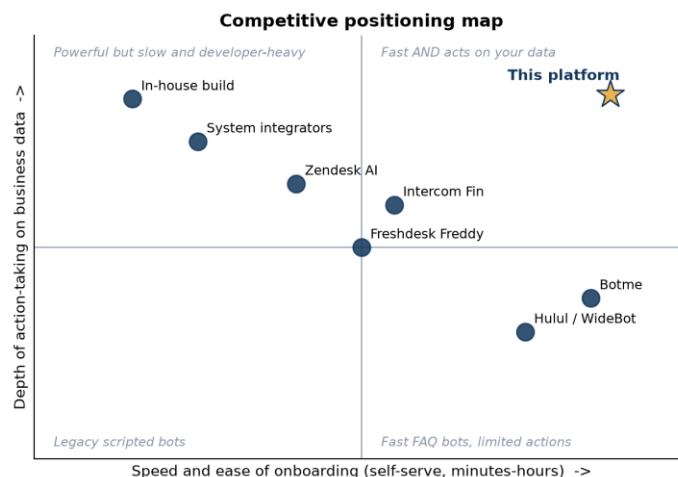

Pillar	What it is	Why it is hard to replace
1. Automated tool generation	Action tools are generated from the business's own schemas, exports or API specs, then approved by the owner	Competitors either script flows (no actions) or require developer-built integrations; our engine turns integration into configuration.
2. Plug-and-play onboarding	Documents in, working agent out, with light adjustments in a Control Center	Speed compounds: every onboarding teaches the engine new document and schema patterns; industry packs accumulate.
3. Egyptian Arabic first	Dialect-aware understanding and replies, seamless Arabic/English switching, tone controls	Global vendors optimise for English and Modern Standard Arabic; local nuance is our home ground.
4. Safety and human escalation by design	Policy-derived guardrails, confidence thresholds, identity checks, full-context hand-over, audit log	Trust is the buying criterion for fintech, telecom and airlines; safety architecture is not a feature that can be bolted on later.
5. EGP pricing and Egypt-hosted data	Flat tiers in Egyptian pounds; option to keep tenant data in Egypt; PDPL-aware processing	USD pricing exposes Egyptian SMEs to FX risk; cross-border transfers need PDPC permits from 31 Oct 2026; local hosting is a real advantage.

Defensibility over time

- **Data network effect:** anonymised patterns of what customers ask in each vertical improve default tools and guardrails for the next customer.
- **Industry packs:** pre-built policy templates and tool sets for telecom, e-commerce, fintech, hospitality and airlines shorten onboarding further.
- **Switching cost:** once the audit trail, escalation workflows and tuned rules live in the Control Center, moving is costly for the business.

12. Competitive Analysis

In short: We compete with local flow-builder bots, global AI helpdesks and in-house builds. None combines fast self-onboarding with real action-taking on business data in Egyptian Arabic at EGP prices. That is the gap we occupy.

Competitor matrix

	Hulul / WideBot (Egypt)	Botme	Intercom Fin	Zendesk AI	Freshdesk Freddy	In-house build	This platform
Public pricing	EGP 700 / 1,400 / 3,500 per month	Tiered, messages-based	USD 0.99 per resolution + USD 29-132 per seat	USD 55-169 per seat; ~USD 1.50-2.00 per resolution (est.)	USD 19-89 per seat; USD 0.49 per AI session	EGP 300,000+ build, ongoing dev cost	EGP 2,500 / 7,500 / 20,000; enterprise from 60,000
Arabic / Egyptian dialect	Strong (Arabic-first, 12 dialects)	Multilingual	Basic	Basic	Basic	Depends	Egyptian-first + English
Answers from own documents	Partly (generative add-on)	Yes	Yes	Yes	Yes	Yes	Yes
Acts on business data	Limited, via integrations	Limited (calendar, forms)	Yes, with developer setup	Yes, with developer setup	Partly	Yes	Yes, auto-generated tools
Self-serve onboarding	Yes (flow builder)	Yes (5 minutes, docs only)	Partly	No	Partly	No	Yes, documents + data
Human escalation	Yes	Lead form	Yes	Yes	Yes	Custom	Yes, with context
Owner Control Center (plain language)	Flow editor	Basic	Admin console	Admin console	Admin console	None	Yes
Egypt-hosted data / PDPL	On-prem available (enterprise)	No	No	No	No	Yes	Optional Egypt hosting
Voice	Yes (voicebot)	No	Yes (usage-based)	Yes	Limited	Custom	Roadmap 2028

How we position against each

- **vs Hulul / WideBot:** the local benchmark (40,000+ brands, strong Arabic). We do not compete on cheap FAQ bots; we win where the agent must act on data safely.
- **vs Intercom / Zendesk / Freshdesk:** strong products priced in USD per seat and per resolution for English-first teams with developers. We win on EGP pricing, Egyptian Arabic, onboarding speed and local hosting.
- **vs in-house build:** days instead of months, and kept current as policies change.

13. Business Model Canvas

In short: A subscription software business: we sell flat monthly plans in EGP to Egyptian businesses, delivered through self-serve onboarding and a partner channel, built on cloud AI infrastructure and a small expert team.

Key Partners - Meta Business Solution Provider for WhatsApp - Cloud & LLM providers (multi-vendor) - Egyptian data-centre / hosting partner - E-commerce platforms & agencies (Salla, Shopify partners) - Telecom & fintech system integrators - ITIDA / NTI ecosystem	Key Activities - Ingestion & tool-generation engine R&D - Arabic dialect quality & evaluation - Safety, guardrails, audit - Pilot delivery & customer success - Industry pack development Key Resources - AI/backend engineering team - Proprietary ingestion & tool-generation pipeline - Evaluation datasets (Egyptian Arabic) - Industry packs - PDPC licence & compliance posture	Value Propositions - Working AI support + CRM agent in hours - Acts on your data, bounded by your policies - Egyptian Arabic + English - Owner-controlled, no developers needed - Built-in human escalation - EGP pricing, Egypt-hosted option	Customer Relationships - Self-serve onboarding + guided pilot - Customer success for Growth+ tiers - Dedicated manager for Enterprise - Community & templates library Channels - WhatsApp/LinkedIn founder-led outreach - Partner agencies & integrators - Content & webinars (Arabic) - Events (RiseUp, Cairo ICT, Techne) - Referrals from pilots	Customer Segments - Telecom / ISP / subscription services - E-commerce & online retail - Fintech & lending - Hospitality & travel - Airlines - Any domain (secondary)
Cost Structure - Salaries (largest, ~65% of fixed) - Cloud & AI inference (variable, ~EGP 0.5/conversation) - Marketing & events - Legal, PDPL licensing, accounting - Tools, BSP fees, co-working			Revenue Streams - Monthly subscriptions: Starter EGP 2,500 / Growth 7,500 / Business 20,000 - Enterprise contracts from EGP 60,000/month - Paid 60-day pilots EGP 5,000 - Overage EGP 2 per conversation - Add-ons: voice, extra seats, industry packs	

14. Revenue Model and Pricing

In short: Money enters as flat monthly subscriptions in EGP, sized by conversation volume and features, plus paid pilots and enterprise contracts. Flat tiers keep budgets predictable for Egyptian SMEs; Meta's WhatsApp per-message fees are passed through at cost, as is standard.

Plans

	Starter	Growth	Business	Enterprise
Monthly price	EGP 2,500 (USD 49)	EGP 7,500 (USD 146)	EGP 20,000 (USD 388)	from EGP 60,000 (USD 1,165)
Included conversations / month	1,000	5,000	20,000	Custom
Channels	1 (WhatsApp or web)	WhatsApp, web, Messenger, Instagram	All text channels + voice add-on	All + IVR / call deflection
Auto-generated action tools	Up to 3	Up to 10	Unlimited	Unlimited + custom connectors
Knowledge base	Up to 50 documents	Up to 500 documents	Unlimited	Unlimited, multi-brand
Human escalation inbox seats	1	3	10	Custom
Control Center	Basic	Full	Full + roles	Full + SSO
Data hosting	Shared cloud	Shared cloud	Egypt-hosted option	Private cloud or on-premises
Support & SLA	Email	Chat, next business day	Priority, 99.5% uptime SLA	Dedicated success manager, custom SLA
Best for	Small shops, single channel	Growing brands, hotels, agencies	High-volume retailers, ISPs, fintechs	Telecom operators, airlines, banks

Other revenue lines

- **Paid pilot:** EGP 5,000 for 60 days with Growth features and hands-on onboarding; the fee is credited against the first annual contract.
- **Overage:** EGP 2 per conversation above the plan allowance, with alerts at 80% and 100%.
- **Add-ons:** voice channel, extra inbox seats, industry packs, custom connectors (enterprise).
- **Pass-through:** Meta WhatsApp per-message fees (Egypt: USD 0.0036 per utility/service message plus 14% VAT from 1 Oct 2026) are billed at cost.

Pricing logic

Growth at EGP 7,500 sits 2x above Hulul's top tier (EGP 3,500) and about half of what a single Arabic-speaking agent costs fully loaded. For a business handling 5,000 conversations a month, Intercom Fin would cost roughly USD 0.99 x resolved conversations plus seats, i.e. well above EGP 100,000 a month at 60% resolution; our flat EGP 7,500 is an order of magnitude cheaper and predictable. Blended ARPU in the model is EGP 6,250 in 2027 rising to EGP 7,375 in 2029 as the mix shifts to Growth and Business.

Sources: hulul.net/pricing; intercom.com/pricing; Meta WhatsApp Business Platform pricing (Egypt rate card, July 2026 update, chatmaxima.com summary).

15. Go-to-Market Strategy

In short: We launch with founder-led, paid pilots in five verticals, turn those pilots into public case studies, then scale through partner agencies and integrators who already serve Egyptian SMEs, supported by Arabic content and industry events.

Phased approach

Phase	Timing	Objective	Motion
0. Discovery	Oct-Nov 2026	30+ structured interviews across the five verticals; validate willingness to pay and onboarding assumptions	Founder network, NTI/ITIDA ecosystem, LinkedIn
1. Founding pilots	Q1-Q2 2027	5-8 paid pilots, 3 public case studies with measured results	Direct, founder-led selling; hands-on onboarding
2. Self-serve launch	Q3 2027	Starter and Growth tiers open; 40 paying customers by year-end	Arabic content, webinars, referral programme, WhatsApp-native demos
3. Partner channel	2028	Agencies, e-commerce platform partners and integrators resell or refer; 150 customers; first 2 enterprise contracts	Partner programme with 15-20% referral commission; co-marketing
4. Enterprise & regional	2029	Industry packs for telecom, airlines, fintech; 300 customers; 4 enterprise contracts; GCC groundwork	Enterprise sales, RFP responses, system-integrator alliances

Acquisition channels

- **Founder-led direct sales:** the primary channel in 2027; every pilot is a reference.
- **Partners:** e-commerce agencies, WhatsApp BSPs, telecom and fintech integrators who lack an AI-agent layer.
- **Content in Arabic:** practical guides ('how to write a return policy an AI can follow'), demo videos on WhatsApp, LinkedIn thought leadership.
- **Events:** RiseUp Summit, Cairo ICT, Techne Summit, fintech and tourism trade gatherings.
- **Ecosystem:** NTI, ITIDA and incubator networks for credibility and introductions, not funding.

Sales model

Starter and Growth are self-serve with optional guided onboarding. Business is sold through a short consultative process (demo, pilot, contract). Enterprise follows a 3-6 month cycle with security review, PDPL documentation, private hosting and a dedicated success manager.

16. Marketing and Sales Funnel

In short: In 2028 we need about 125 new paying customers. Working back through realistic conversion rates, that means reaching roughly 6,000 target businesses, engaging 600, qualifying 240, running 100 paid pilots and converting 65 of them, plus ~60 direct self-serve sign-ups.

2028 acquisition funnel (annual volumes, conversion rate at right)

Stage	2028 volume	Conversion to next stage	Main levers
Reached (campaigns, partners, events)	6,000	10%	Arabic content, partner lists, event follow-ups
Engaged (demo request or trial signup)	600	40%	WhatsApp-native demo, instant sandbox with sample documents
Qualified discovery call	240	42%	Fit criteria: volume 500+ conversations/month, written policies, data source available
Paid pilot started (EGP 5,000)	100	65%	Defined success criteria, hands-on onboarding, weekly review
Converted to paying plan	65 (+~60 direct self-serve)	-	Pilot fee credited; founding-customer pricing lock for 12 months

Funnel volumes are planning assumptions to be calibrated during the 2027 pilots. Pilot-to-paid conversion of 65% is the single most important rate in the model; Section 20 tracks it as a headline KPI.

17. Operations / Delivery Model

In short: Delivery is mostly software, so operations centre on three things: keeping the platform reliable, onboarding customers well, and handling escalations and compliance. A lean team of five runs this in 2027, growing to about eleven by 2029.

Operating model

Function	What it covers	Who (2027)	Tools / partners
Platform engineering	Ingestion, tool generation, agent runtime, channels, Control Center, security	2 AI/backend engineers, 1 full-stack engineer	Cloud provider, LLM APIs (multi-vendor), vector database, monitoring
Customer onboarding & success	Guided pilots, data-source connection, tool approval sessions, weekly reviews	Product & operations lead, sales & customer success	Control Center, onboarding checklist, shared WhatsApp groups
Sales & partnerships	Pipeline, pilots, partner programme	Sales & customer success (founder support)	CRM, partner portal (2028)
Quality & safety	Arabic evaluation sets, red-teaming of tools, escalation review, incident response	AI engineers + product lead	Evaluation harness, audit log, incident playbook
Compliance & finance	PDPC registration/licence, DPO role, contracts, invoicing in EGP, VAT	Product & operations lead + external counsel/accountant	Law firm, accountant, e-invoicing

Service delivery flow

1. Sign-up or pilot agreement; success criteria agreed in writing (resolution rate, first-response time, escalation quality).
2. Onboarding session (60-90 minutes for SMEs): upload, tool approval, tone and rule setting, channel connection.
3. Go-live with 'shadow mode' for the first days if the customer prefers: the agent drafts, a human approves, then autonomy is switched on per tool.
4. Weekly review in the pilot period; monthly afterwards for Growth+; quarterly business review for Enterprise.
5. Continuous: uptime monitoring, model-quality monitoring, cost monitoring per tenant, PDPL record-keeping.

Key suppliers and dependencies

- Language-model providers: multi-vendor routing (OpenAI, Google, Anthropic or open-weight models) to control cost and avoid lock-in.
- Meta WhatsApp Business Platform via a Business Solution Provider; Messenger and Instagram via the same Meta stack.
- Cloud hosting with an Egyptian data-centre partner for the Egypt-hosted option (Telecom Egypt and others operate local data centres).
- Legal counsel for PDPL licensing and contracts; accountant for VAT and e-invoicing.

18. High-level Technology Overview

In short: Think of the platform as four layers: an intake layer that reads your documents and data structure, a generation layer that builds knowledge and tools, an agent layer that talks to customers and acts safely, and a control layer for the owner. Each business lives in its own isolated workspace.

Layer	Business purpose	Main components (plain language)
1. Intake	Accept what the business already has	Document parsers (PDF, Word, spreadsheets, web pages); schema and API readers; language detection; tenant workspace creation
2. Generation	Turn inputs into a working configuration	Knowledge indexing (retrieval-augmented generation); automatic tool generation from schemas/APIs using a standard tool protocol; policy-to-guardrail extraction
3. Agent runtime	Serve customers safely on every channel	Conversation engine; retrieval; tool execution with validation and permissions; confidence scoring; escalation router; channel connectors (WhatsApp, web, Messenger, Instagram; voice later)
4. Control & trust	Give the owner control and evidence	Business Owner Control Center; plain-language rule editor; audit log of answers and actions; dashboards; data-retention and export controls

Design principles that matter to the business

- **Isolation:** one workspace, knowledge index and tool set per business; no cross-tenant data access.
- **Bounded actions:** tools are generated with explicit fields, validations and permission levels; the owner approves each one; high-risk tools default to 'ask a human'.
- **Grounded answers:** the agent cites the policy passage it relied on; if nothing relevant is found, it escalates instead of guessing.
- **Model independence:** budget-tier models handle routine turns (about USD 0.20-0.25 per million input tokens), stronger models are used only where needed; providers can be swapped.
- **Egypt-ready:** Egypt-hosted storage option, encryption at rest and in transit, 72-hour breach-notification readiness as required by the PDPL executive regulations.
- **Observability:** per-tenant cost, quality and escalation metrics feed both the customer dashboard and our own KPIs.

What we deliberately do not build

We do not train our own foundation models, build our own messaging infrastructure or run our own data centres. We integrate best-in-class components and focus engineering effort on the two things that differentiate: automated tool generation and safe, Egyptian-Arabic-first agent behaviour.

Sources: OpenAI, Google and Anthropic API pricing pages (Sept 2026); PDPL Executive Regulations (Decree 816/2025) summaries by Clyde & Co and ICLG.

19. Validation / Traction Approach

In short: The platform is at concept stage: no code has been written and there are no customers yet. This section therefore sets out how we will prove the idea in stages, what evidence each stage must produce, and what would make us stop or change course.

Stage	Timing	What we test	Evidence required to proceed
1. Problem interviews	Oct-Nov 2026	30+ interviews with owners and support leads across the five verticals	At least 60% rank support cost/coverage as a top-3 problem; at least 15 agree to see a prototype
2. Concierge prototype	Dec 2026-Feb 2027	Manually onboard 3 businesses using off-the-shelf components; measure time, answer quality, escalations	Onboarding under 1 day; >70% of test questions answered correctly from documents; owners willing to pay a pilot fee
3. MVP + paid pilots wave 1	Mar-Jun 2027	Self-serve ingestion, generated tools, Control Center, WhatsApp + web; 5-8 paid pilots	Pilot fee paid by 5+ businesses; >60% autonomous resolution; <5% escalation failures; 3 case studies
4. Conversion & retention	Jul-Dec 2027	Pilot-to-paid conversion, monthly churn, self-serve onboarding without our help	>=60% pilot conversion; monthly churn <=5%; >=10 self-serve onboardings completed without assistance
5. Enterprise proof	2028	One telecom/ISP or airline pilot with API-based tools and Egypt hosting	Signed enterprise contract; security and PDPL review passed

Pilot success criteria (agreed with each pilot customer)

- Time from documents received to first live conversation.
- Share of conversations resolved without a human (target 60%+ by week 4).
- Median first-response time (target under 1 minute).
- Escalation quality: share of hand-overs where the human had everything needed (target 90%+).
- Customer satisfaction on resolved chats (thumbs-up rate, target 80%+).
- Owner effort: hours spent per week maintaining the agent (target under 1 hour).

Kill or pivot signals

If fewer than half of interviewed businesses see the problem as urgent, if pilots cannot exceed 50% autonomous resolution after tuning, or if pilot conversion is below 40%, we will revisit the segment focus, the pricing or the product scope before spending further.

20. Key Performance Indicators

In short: We will manage the business with a small dashboard: customer and revenue growth, unit economics, product quality, and onboarding speed. Targets below are for end-2027 and end-2028.

Area	KPI	Definition	End-2027 target	End-2028 target
Growth	Paying customers	Active SMB subscriptions	40	150 (+2 enterprise)
Growth	Monthly recurring revenue (MRR)	Sum of active monthly subscriptions	EGP 250K	EGP 1,151K
Funnel	Pilot-to-paid conversion	Pilots converting within 30 days of pilot end	>= 60%	>= 65%
Retention	Monthly logo churn	Cancelled subscriptions / active at start of month	<= 5%	<= 4%
Retention	Net revenue retention	MRR from existing customers vs 12 months earlier	>= 95%	>= 105%
Unit economics	CAC and LTV:CAC	Fully loaded acquisition cost; lifetime gross profit / CAC	CAC <= EGP 20,000; LTV:CAC >= 4	CAC <= EGP 15,000; LTV:CAC >= 9
Unit economics	Gross margin	(Revenue - AI compute, infra, payment fees) / revenue	>= 70%	>= 75%
Product	Autonomous resolution rate	Conversations closed without a human	>= 60%	>= 70%
Product	Escalation quality	Hand-overs with complete context (human rating)	>= 90%	>= 95%
Product	Customer satisfaction	Thumbs-up rate on resolved chats	>= 80%	>= 85%
Onboarding	Time to first live conversation	Median, from sign-up	< 1 day	< 2 hours
Onboarding	Owner maintenance effort	Hours per week in the Control Center	< 1 hour	< 30 minutes
Reliability	Platform uptime	Monthly availability of agent runtime	99.5%	99.9%

21. Financial Assumptions

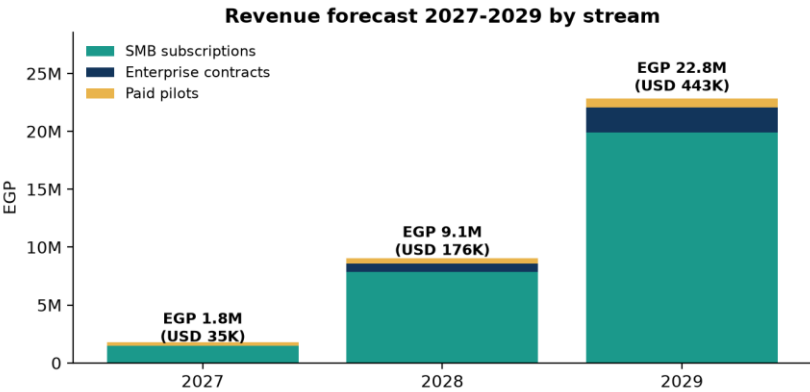

In short: The forecast rests on a handful of drivers: how many customers we win each year, what they pay, what each conversation costs us, and what the team costs. All are listed here so they can be challenged and updated.

Driver	Assumption	Basis
Exchange rate	51.5 EGP per USD	CBE mid-rate September 2026 (51.3-51.8)
Plan prices	Starter 2,500 / Growth 7,500 / Business 20,000 / Enterprise from 60,000 EGP per month	Section 14; benchmarked against Hulul (EGP 700-3,500) and Intercom/Zendesk (USD)
Tier mix (Starter/Growth/Business)	2027: 50/40/10; 2028: 45/42/13; 2029: 40/45/15	Shift toward higher tiers as case studies and industry packs mature
Blended ARPU	EGP 6,250 (2027), EGP 6,875 (2028), EGP 7,375 (2029) per month	Derived from prices and mix
Paying customers (end of year)	40 / 150 / 300	Pilot conversion 65%; funnel in Section 16
Enterprise contracts	0 / 2 (from mid-2028) / 4 (2 full-year + 2 from mid-2029)	One telecom/ISP and one travel/airline pilot in 2028
Paid pilots	60 / 100 / 150 per year at EGP 5,000	Pilot fee credited against first annual contract (treated as revenue when earned)
Conversation usage	50% of plan allowance on average	Typical SaaS utilisation; overage revenue not counted (upside)
Variable cost per conversation	EGP 0.50 (LLM tokens, embeddings, vector search, compute)	Budget-tier model at USD 0.20-0.25 per 1M input tokens; ~6 turns per conversation; prompt caching
Payment processing	2.5% of revenue	Card / wallet gateway fees in Egypt
WhatsApp fees	Passed through at cost; not in our revenue or cost	Meta Egypt rate USD 0.0036 per utility/service message + 14% VAT from 1 Oct 2026
Team	5 people (2027), 8 (2028), 11 (2029)	Section 23; salaries at Egyptian mid-level market rates
Salary inflation and employer load	15% per year; 20% employer social insurance and benefits	Egyptian wage inflation 2024-2026; social insurance law
Monthly churn	4% (base), 6% (stress)	SMB SaaS benchmarks; validated in pilots
CAC	EGP 15,000 (base), EGP 25,000 (stress)	2028 sales and marketing spend / new customers, fully loaded
Taxes and financing	Not modelled (EBITDA level)	Corporate tax 22.5%; no debt assumed

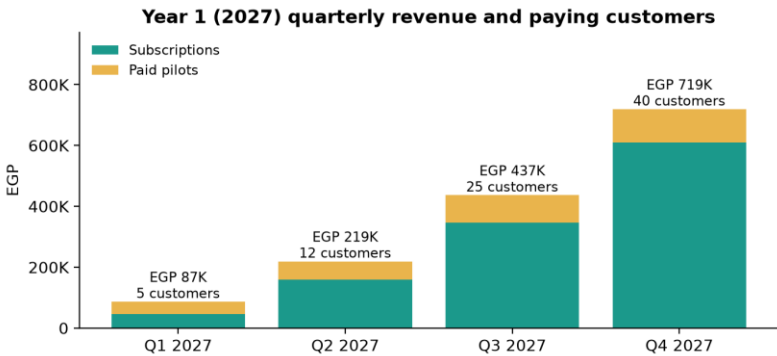

Sources: Fexant CBE USD/EGP history; OpenAI/Google/Anthropic pricing; Meta WhatsApp pricing; CV Pro Maker and WUZZUF salary data; management estimates.

22. Revenue Forecast

In short: Revenue grows from EGP 1.8M in 2027 to EGP 9.1M in 2028 and EGP 22.8M in 2029 (about USD 443K), driven by customer count, a shift to higher tiers and the first enterprise contracts.

Year 1 in detail (quarterly)

	Q1 2027	Q2 2027	Q3 2027	Q4 2027	FY 2027
Paying customers (end of quarter)	5	12	25	40	40
Paid pilots started	8	12	18	22	60
Revenue	EGP 87K	EGP 219K	EGP 437K	EGP 719K	EGP 1.8M

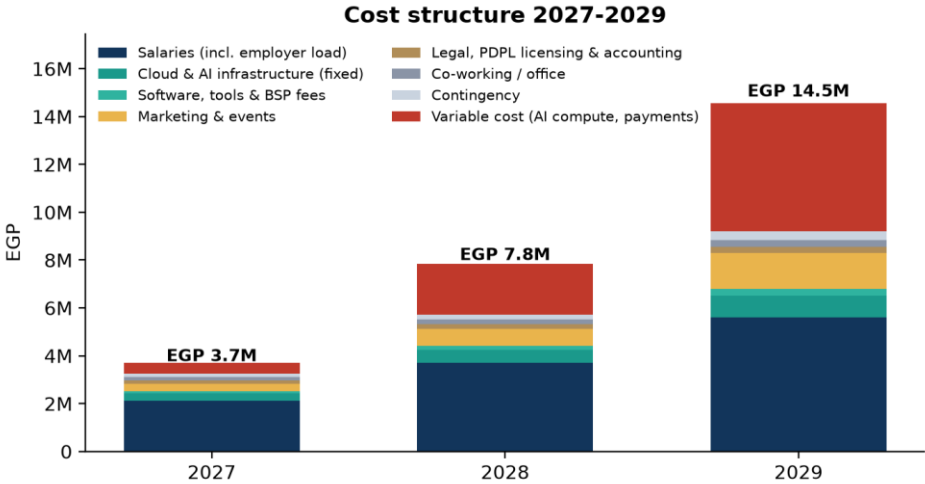

Three-year view

	2027	2028	2029
Paying SMB customers (end of year)	40	150	300
Enterprise contracts (active at year end)	0	2	4
Blended ARPU (EGP / month)	6,250	6,875	7,375
SMB subscription revenue	EGP 1.5M	EGP 7.8M	EGP 19.9M
Enterprise revenue	EGP 0.0M	EGP 0.7M	EGP 2.2M
Paid pilot revenue	EGP 0.3M	EGP 0.5M	EGP 0.8M
Total revenue	EGP 1.8M	EGP 9.1M	EGP 22.8M
Total revenue (USD)	USD 35K	USD 176K	USD 443K

Growth drivers: pilot conversion (Section 16), partner channel from 2028, tier upgrades as customers grow, and enterprise contracts from mid-2028. Overage revenue and add-ons are excluded and represent upside.

23. Cost Structure

In short: People are the largest cost at roughly two-thirds of fixed spend. Variable costs (AI compute, infrastructure, payment fees) stay near a quarter of revenue thanks to budget-tier models and flat pricing. Total costs rise from EGP 3.7M in 2027 to EGP 14.5M in 2029.

Cost line (EGP)	2027	2028	2029
Salaries (incl. employer load)	EGP 2.1M	EGP 3.7M	EGP 5.6M
Cloud & AI infrastructure (fixed)	EGP 0.3M	EGP 0.5M	EGP 0.9M
Software, tools & BSP fees	EGP 0.1M	EGP 0.2M	EGP 0.3M
Marketing & events	EGP 0.3M	EGP 0.7M	EGP 1.5M
Legal, PDPL licensing & accounting	EGP 0.1M	EGP 0.2M	EGP 0.2M
Co-working / office	EGP 0.1M	EGP 0.2M	EGP 0.3M
Contingency	EGP 0.1M	EGP 0.2M	EGP 0.3M
Total fixed costs	EGP 3.2M	EGP 5.7M	EGP 9.2M
Variable costs (AI compute, infra, payment fees)	EGP 0.5M	EGP 2.1M	EGP 5.3M
Total costs	EGP 3.7M	EGP 7.8M	EGP 14.5M
Headcount (end of year)	5	8	11

Team plan and salary basis (2027 monthly gross, EGP)

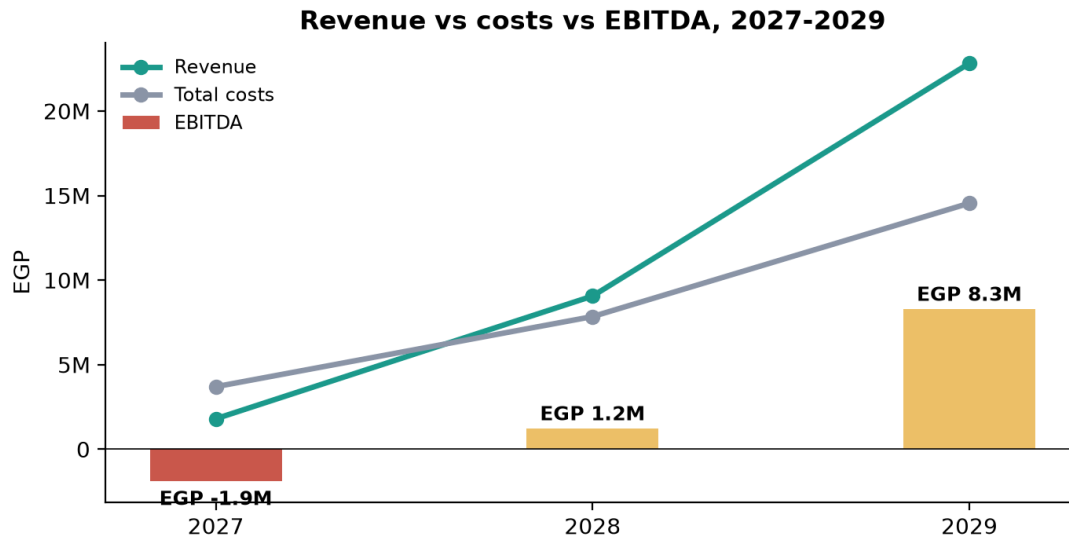

Role	2027	2028	2029	Monthly gross (2027 base)
AI / backend engineer	2	3	3	35,000
Full-stack engineer	1	1	2	28,000
Product & operations lead	1	1	1	30,000
Sales & customer success	1	1	1	20,000 + commission
Sales executive	-	1	1	22,000 + commission
Partner & channel manager	-	-	1	25,000
Onboarding & support specialist	-	1	2	18,000

Salaries sit in the mid-level local range for Egyptian tech roles (software engineers EGP 18,000-42,000 mid-level; AI/ML EGP 30,000-55,000). Employer load of 20% and 15% annual wage inflation are applied on top.

Sources: CV Pro Maker Egypt tech salaries 2026 (egytech.fyi survey); mafeshsho8l Egypt salary guide 2026; WUZZUF.

24. Profitability Projection

In short: The business loses EGP 1.9M in 2027 while building and piloting, turns EBITDA-positive during 2028 (EGP 1.2M for the year) and reaches EGP 8.3M EBITDA in 2029, a 36% margin.

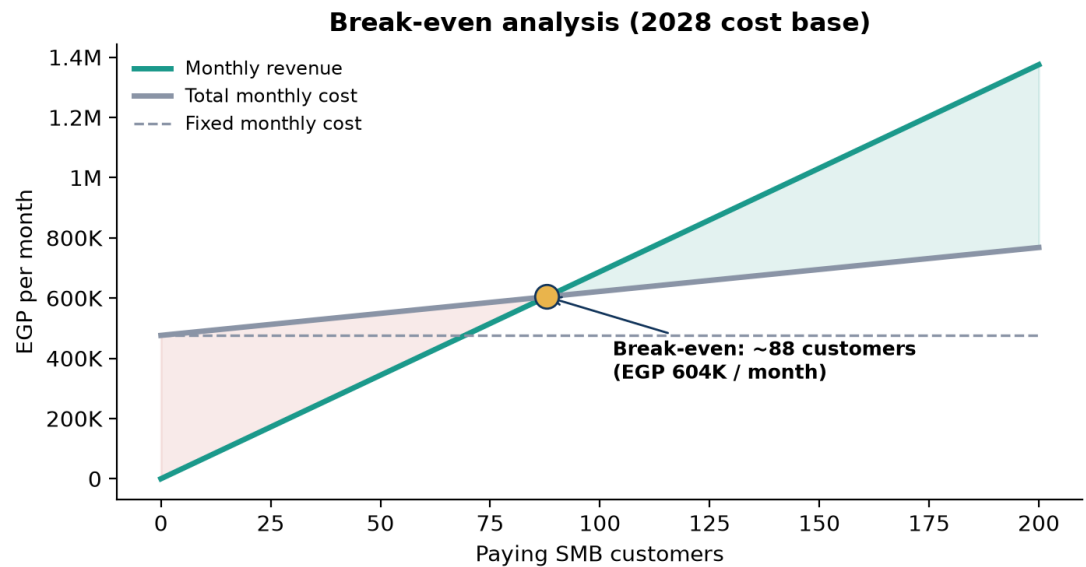

EGP	2027	2028	2029
Revenue	EGP 1.8M	EGP 9.1M	EGP 22.8M
Variable costs	(EGP 0.5M)	(EGP 2.1M)	(EGP 5.3M)
Gross profit	EGP 1.4M	EGP 6.9M	EGP 17.5M
Gross margin	75%	76%	77%
Fixed costs	(EGP 3.2M)	(EGP 5.7M)	(EGP 9.2M)
EBITDA	EGP -1.9M	EGP 1.2M	EGP 8.3M
EBITDA margin	-105%	13%	36%

Reading the numbers

- **2027 is an investment year:** five salaries and the pilot programme against a small but growing customer base.
- **Monthly break-even arrives around June 2028:** when paying customers pass roughly 88 on the 2028 cost base (Section 25).
- **2029 margins reflect software economics:** fixed costs grow with headcount, revenue grows with customers; each additional customer adds ~79% gross margin.
- **Not included:** corporate tax (22.5%), overage and add-on revenue (upside), any external financing.

25. Break-even Analysis

In short: On the 2028 cost base we cover all fixed costs with about 88 paying SMB customers, which the plan reaches around June 2028. On the leaner 2027 cost base the figure is about 54 customers.

Calculation

	2027 cost base	2028 cost base
Monthly fixed costs	EGP 270,600	EGP 476,073
Blended ARPU per customer / month	EGP 6,250	EGP 6,875
Variable cost per customer / month	EGP 1,281	EGP 1,459
Contribution per customer / month	EGP 4,969	EGP 5,416
Break-even customers = fixed / contribution	54	88
Break-even monthly revenue	EGP 340,377	EGP 604,363

Enterprise contracts shorten the path: one EGP 60,000 contract replaces roughly nine SMB customers in contribution terms. The break-even count is sensitive to ARPU; a 20% lower blended ARPU raises the 2028 figure to about 110 customers.

26. Unit Economics

In short: Each customer is worth acquiring: a customer costing EGP 15,000 to win generates about EGP 135K of gross profit over an expected 25-month life, an LTV:CAC of 9:1 with payback in about 3 months. Even under stress (CAC EGP 25,000, churn 6%) the ratio stays at 3.6:1.

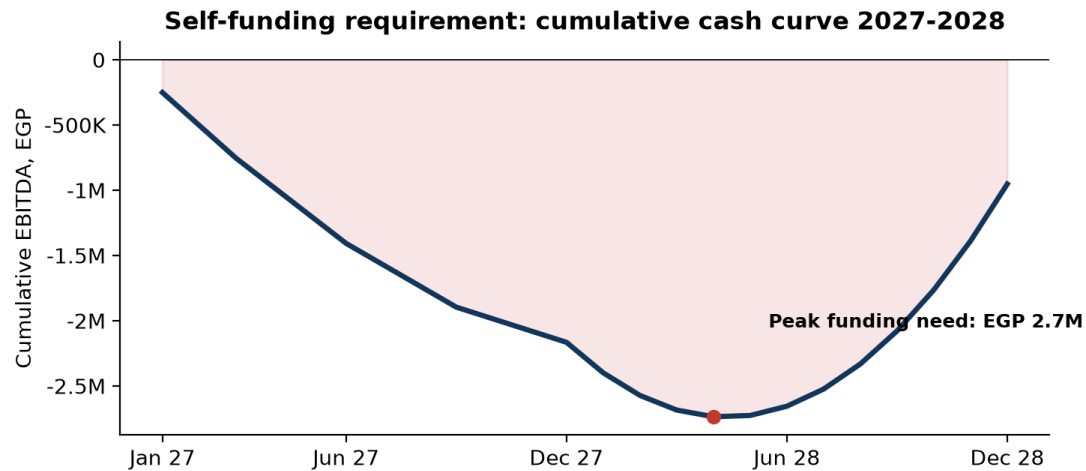

EGP 15,000	EGP 135K	9:1	2.8 mo	79%
Customer acquisition cost (fully loaded)	Lifetime value (gross profit)	LTV : CAC	CAC payback	Gross margin per customer

Metric	Base case	Stress case	How it is calculated
Blended ARPU (2028)	EGP 6,875	EGP 6,875	Prices x tier mix
Gross margin	79%	79%	1 - (variable cost per conversation x conversations) / ARPU - payment fees
Monthly gross profit per customer	EGP 5,416	EGP 5,416	ARPU x gross margin
Monthly churn	4%	6%	Cancelled / active
Expected lifetime	25 months	17 months	1 / monthly churn
LTV	EGP 135,391	EGP 90,260	Monthly gross profit x lifetime
CAC	EGP 15,000	EGP 25,000	Sales + marketing spend / new customers
LTV : CAC	9.0	3.6	Healthy SaaS benchmark >= 3
Payback period	2.8 months	4.6 months	CAC / monthly gross profit

Base-case CAC reflects founder-led and partner-referred sales with modest paid marketing; it will be recalculated from actual 2027 spend. Churn is the assumption with the least evidence today and is the first thing the pilots must measure.

27. Funding Requirements

In short: We are not raising external equity. The plan is self-funded by the founders and by paid pilots. The cumulative cash gap peaks at about EGP 2.7M (USD 53K) in early 2028 before the business funds itself.

How the gap is covered

Source	Amount / mechanism	Notes
Founders' contribution (cash and reduced salaries)	~EGP 2.2M	Founding engineers and product lead draw below-market pay in 2027; difference treated as sweat equity
Paid pilots	EGP 0.3M in 2027	60 pilots x EGP 5,000; also funds onboarding effort
Annual prepayment discount	10% discount for annual plans	Pulls cash forward; not modelled in revenue timing (upside to cash)
Ecosystem support (non-dilutive)	In-kind: cloud credits, mentoring, workspace	NTI / ITIDA / incubator programmes; cloud provider startup credits typically USD 5,000-25,000

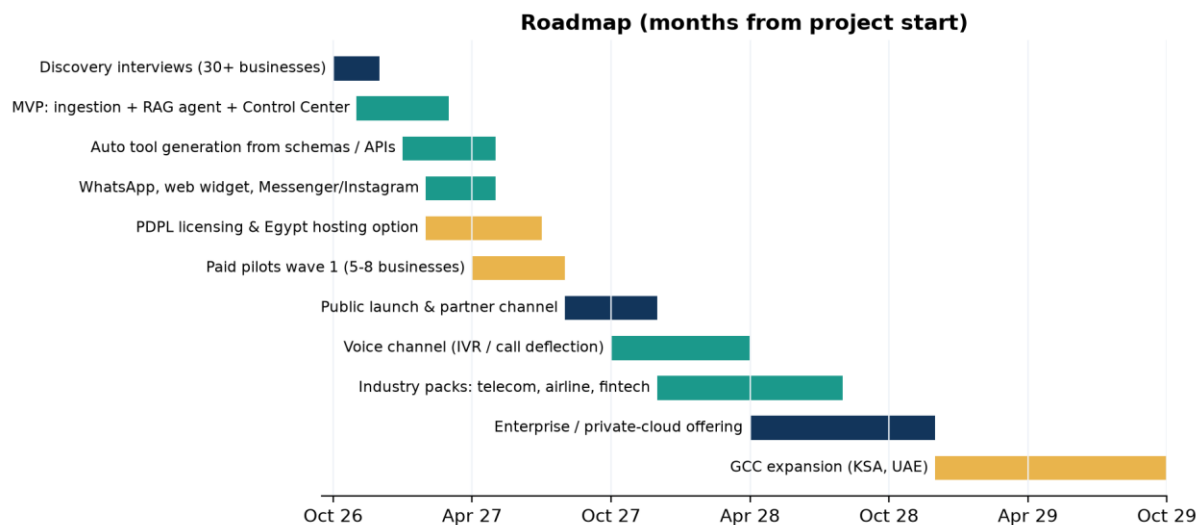

Use of funds 2027 (EGP)

Category	Amount	Share
Salaries (incl. employer load)	EGP 2.1M	66%
Cloud & AI infrastructure (fixed)	EGP 0.3M	9%
Software, tools & BSP fees	EGP 0.1M	3%
Marketing & events	EGP 0.3M	9%
Legal, PDPL licensing & accounting	EGP 0.1M	5%
Co-working / office	EGP 0.1M	4%
Contingency	EGP 0.1M	5%
Total 2027 fixed spend	EGP 3.2M	100%

If growth outpaces the plan (for example, an enterprise contract in 2027) we may consider a small strategic round to accelerate hiring; this is optional, not required for the base case.

28. Roadmap

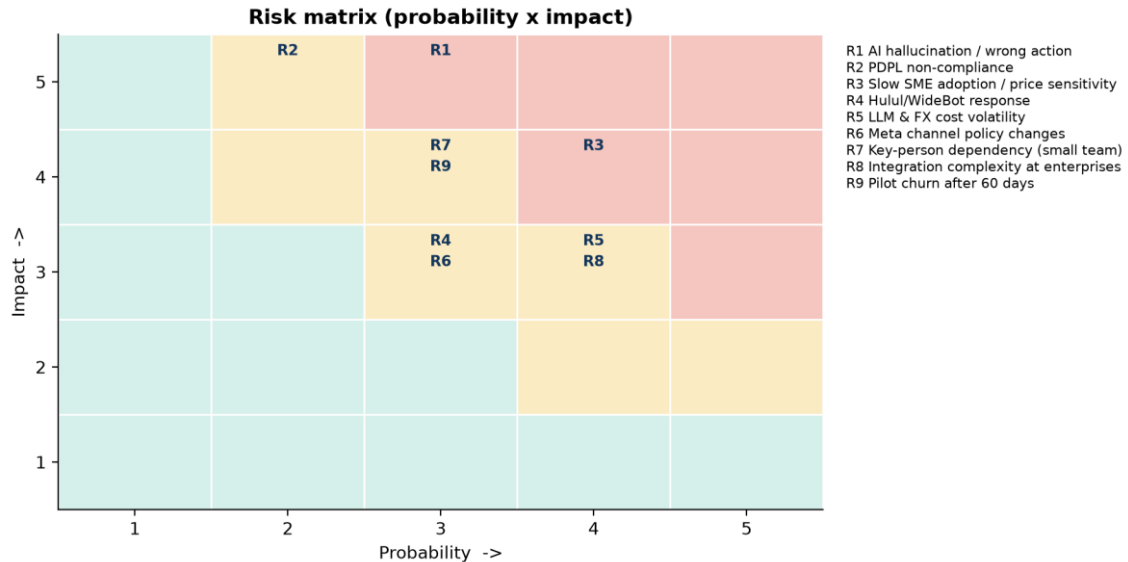

In short: From discovery in late 2026 to founding pilots in H1 2027, public launch in late 2027, voice and industry packs in 2028, and an enterprise offering plus GCC groundwork in 2029.

Milestone	Target date	Definition of done
Discovery complete	Nov 2026	30+ interviews; 15 prototype commitments; pricing validated
Concierge prototype	Feb 2027	3 businesses served with manual onboarding; quality baseline measured
MVP live	Apr 2027	Self-serve ingestion, tool generation, Control Center, WhatsApp + web widget
Founding pilots wave 1	Jun 2027	5-8 paid pilots running; 3 case studies drafted
PDPC registration / licence	Sep 2027	Controller/processor registration filed; Egypt-hosted option available
Public self-serve launch	Q4 2027	Starter and Growth open; 40 paying customers
Partner programme	Q1 2028	10 active partners; referral commission live
Voice channel	Q3 2028	IVR / call deflection in Arabic for Business and Enterprise tiers
First enterprise contracts	H2 2028	Two signed (telecom/ISP, travel or airline)
Industry packs	2028-2029	Telecom, airline, fintech, e-commerce, hospitality templates and tool sets
Enterprise / private cloud	H1 2029	On-premises or private-cloud deployment option
GCC groundwork	H2 2029	Saudi/UAE partner and hosting assessment; first regional pilot

29. Risks and Mitigation

In short: The main risks are AI mistakes, data-protection compliance, slow SME adoption, and dependence on a small team and on third-party platforms. Each has a concrete mitigation built into the product or the plan.

#	Risk	P	I	Mitigation
R1	AI gives a wrong answer or takes a wrong action, damaging a customer relationship	3	5	Grounded answers with cited policy passages; tools with validation and permission levels; high-risk tools default to human approval; shadow mode at launch; audit log; incident playbook
R2	Non-compliance with PDPL (licensing, cross-border transfer, breach notification) after 31 Oct 2026	2	5	PDPC registration in 2027; Egypt-hosted option; DPO role assigned; 72-hour breach process; data-processing agreements with every customer; external counsel
R3	Egyptian SMEs adopt slowly or resist the price	4	4	Paid pilots with written success criteria; EGP flat pricing; Starter tier; case studies in Arabic; ROI calculator; annual-plan discount
R4	Hulul/WideBot or a global vendor adds similar automated tool generation	3	3	Speed and focus; industry packs; Egyptian-Arabic evaluation data; switching costs via Control Center and audit history
R5	LLM prices or the EGP/USD rate move against us	4	3	Multi-vendor model routing; budget-tier models for routine turns; prompt caching; price-review clause; hedging by pricing in EGP with annual review
R6	Meta changes WhatsApp policies or fees (e.g., per-message service charges from Oct 2026)	3	3	Fees passed through at cost; multi-channel design (web, Messenger, Instagram, voice) so no single channel is critical
R7	Key-person dependency in a five-person team	3	4	Documentation, code reviews, shared ownership; early hire of a third engineer in 2028; advisor bench
R8	Enterprise integrations prove more complex than 'light adjustment'	4	3	Enterprise tier priced for services; API-first connectors; system-integrator partners; honest scoping in pilots
R9	Pilots do not convert after 60 days	3	4	Success criteria agreed upfront; weekly reviews; pilot fee credited on conversion; founding-customer price lock

P = probability, I = impact, each scored 1 (low) to 5 (high).

30. Team and Capabilities

In short: Execution needs four capabilities: applied AI engineering, product and operations discipline, Egyptian-market sales, and compliance. The founding team covers the first two; the plan hires the rest and adds advisors for the industries we serve.

Role	Responsibilities	Capabilities required	Status
Founder / technical lead (AI & backend)	Architecture, ingestion and tool-generation engine, model routing, safety	Applied LLM engineering, retrieval systems, API design, security	Founding team
Founder / product & operations lead	Product scope, Control Center UX, pilots, PDPL programme, finance	Product management, customer discovery, operations, compliance coordination	Founding team
AI / backend engineer	Channel connectors, evaluation harness, Arabic quality	Python, NLP evaluation, Egyptian Arabic fluency	Hire Q1 2027
Full-stack engineer	Control Center, dashboards, onboarding flows	Web front-end, APIs, usability	Hire Q1 2027
Sales & customer success	Pipeline, pilots, onboarding sessions, renewals	B2B selling to Egyptian SMEs, WhatsApp-native communication	Hire Q2 2027
Advisors (part-time)	Telecom, airline, fintech and e-commerce domain input; legal (PDPL)	Senior operators from target industries; data-protection counsel	Recruit 2026-2027

Why this team can execute

- Technical depth in retrieval-augmented generation and tool-using agents, the two components that make the product different.
- Product discipline: every feature in this proposal maps to a pilot success criterion or a KPI.
- Local advantage: native understanding of Egyptian Arabic, Egyptian business practice and the WhatsApp-first market.
- Cost discipline: a five-person plan that reaches monthly break-even in 2028 without external capital.

Names and biographies are available on request and will be added for specific pilot discussions.

31. Strategic Vision / Future Expansion

In short: Stage one proves the plug-and-play agent in Egypt. Stage two makes it the operating layer for customer operations, with voice, proactive outreach and deeper CRM. Stage three carries the Arabic-first platform into the GCC and adjacent domains.

Stage	Horizon	What we add	Why it matters
1. Prove it in Egypt	2027-2028	Text channels, automated tools, Control Center, industry packs for five verticals, PDPL posture	Establish the category locally; 150+ customers; enterprise references
2. Become the customer-operations layer	2028-2029	Voice (IVR, call deflection), proactive notifications (delivery, renewals, payment reminders), CRM enrichment, agent-assist for human teams, analytics	Higher ARPU; deeper switching costs; the agent becomes the front door of the business
3. Expand regionally and across domains	2029-2030	Saudi Arabia and UAE via partners and local hosting; packs for healthcare, education, real estate, logistics; marketplace for connectors and templates	MEA conversational-AI market USD 3.5B by 2030; Arabic-first capability is the wedge

Long-term positioning

Every business in the region should be able to switch on a safe, knowledgeable, action-taking agent the way it switches on a phone line. We aim to be the default way that happens in Arabic-speaking markets, starting with Egypt.

32. The Ask / Next Steps

In short: We are asking for 5-8 founding pilot customers across telecom/ISP and subscription services, e-commerce, fintech, hospitality/travel and airlines, starting in Q1 2027, on paid 60-day pilots with agreed success criteria and founding-customer pricing.

What we ask of a founding pilot customer

- **A paid 60-day pilot at EGP 5,000** (credited in full against the first annual contract).
- **Your policies and a data source:** policy documents, FAQs, and a customer or order data export, schema or API for one use case.
- **A named business owner and one escalation agent** for a 90-minute onboarding session and a weekly 30-minute review.
- **Permission to publish an anonymised or named case study** if the agreed success criteria are met.

What a founding pilot customer receives

- Growth-tier features during the pilot, with hands-on onboarding by the founding team.
- A written success scorecard: time to go-live, autonomous resolution rate, first-response time, escalation quality, customer satisfaction, owner effort.
- Founding-customer pricing locked for 12 months after conversion, and priority input into the industry pack for your sector.
- A clear exit: if success criteria are not met, the pilot ends with no further obligation.

Next steps

Step	Owner	When
Discovery call (45 minutes): your volumes, channels, policies, data sources	Us + your operations lead	Within 2 weeks
Pilot scope and success criteria agreed in writing	Both	Week 3
Onboarding session and go-live (shadow mode if preferred)	Us + your business owner	Q1 2027, week 1 of pilot
Weekly reviews; final scorecard and conversion decision	Both	Weeks 2-9

Contact: [founder name], [email], [WhatsApp number]. Placeholders to be completed before distribution.

33. Closing Statement

Egyptian businesses do not lack customers, questions or goodwill. They lack a way to answer at scale, safely, in their own voice, without hiring another shift or launching another IT project.

This platform turns the documents and data a business already has into a working AI agent in hours, keeps a human one tap away, and prices it in Egyptian pounds. The market is growing at 23% a year, the technology is finally ready, and the first movers who prove it with real customers will define the category.

Plug in your business. Let your customers feel the difference this quarter.

Modular "Plug-and-Play" AI-Agent Platform for Enterprise Onboarding
