

OVERVIEW

Modular "Plug-and-Play" AI-Agent Platform for Enterprise Onboarding

Plug in your business. A safe, action-taking AI support agent goes live, with only light adjustments and no development project.

Egypt, Arabic-first
For prospective pilot partners

THE MAIN IDEA

A business **uploads what it already has**: its policies, knowledge documents and the structure of its customer data. The platform **turns that into a working AI agent** that answers customers, takes real actions on their data, and hands anything risky to a human.

1

Drop and load

Policies, FAQs, product documents, and a customer or order data source: a spreadsheet, CRM export, database schema or API description.

2

Auto-build and review

The platform builds the private knowledge base and proposes the actions the agent may take. The owner approves them and sets the tone and rules in plain language.

3

Go live

Connect WhatsApp, website chat, Messenger or Instagram. The agent serves customers around the clock; a human inbox receives escalations.

TWO INTERFACES, ONE PLATFORM

Customer-facing agent

- Answers from the business's own policies, in Egyptian Arabic and English
- Looks up orders, bookings, accounts and tickets; updates them within approved limits
- Escalates to a person with the full conversation and context

Business Owner Control Center

- Upload and update documents; switch actions on or off
- Adjust rules and tone in plain language, no code
- Audit every answer and action; manage the human escalation inbox

WHERE IT FITS

Telecom, ISPs and subscription services

E-commerce and online retail

Fintech and lending

Hospitality and travel

Airlines

Any domain, with light adjustments

The same engine works for any business with written policies and structured customer data. The five sectors above are where we start because the volume of customer conversations, and the pain, is highest.

WHAT WE PROMISE

Light developer involvement

Knowledge ingestion and tool creation are automated. Developers make small adjustments instead of running an integration project.

Fast go-live

From documents to a working agent in a fraction of the time a chatbot project normally takes.

Owners can largely self-onboard

Non-technical business owners set up and maintain the agent themselves through the Control Center.

Built-in safety

Actions are bounded by the business's own policies. Anything ambiguous, sensitive or out of scope goes to a human automatically.

Made for Egypt

Egyptian dialect and English, WhatsApp-first, with the option to keep data hosted in Egypt.

WHAT WE ARE LOOKING FOR

Founding pilot partners who will put the platform in front of real customers and help shape it for their industry.

WHAT WE ASK OF YOU

- Your policies and one customer-data source for a single use case
- A named business owner and one escalation agent
- A short, structured pilot with success criteria agreed upfront
- Permission to share the results as a case study if they are met

WHAT YOU GET

- Hands-on onboarding by the founding team
- A written scorecard of what the agent achieved
- Priority input into the industry pack for your sector
- A clear exit if the agreed criteria are not met
